

## CEE is proud to be a member of the World Community Grid

The Center for Excellence in Education (CEE) was co-founded in 1983 by the late Admiral H. G. Rickover, the father of the nuclear navy and of civilian uses of nuclear power, and Joann P. DiGennaro, CEE's President. They recognized that nurturing careers of excellence and leadership in science and technology in young scholars is an essential investment in the United States national and global future. The Center's programs help keep the United States competitive in science and technology and further international understanding among future leaders of the world. CEE challenges students and assists them on a long-term basis to become the creators, inventors, scientists, and leaders of the 21st century.

The Research Science Institute (RSI) was launched in 1984. The nationally and internationally recognized program is collaboratively sponsored each summer with MIT. In 2002, CEE launched the USA Biology Olympiad, the premier competition in biology for high school students in the United States. While the USA has for many years participated in academic Olympiads in mathematics, physics, chemistry, and computer science, the 2003 International Biology Olympiad (IBO) was the first at which the U.S. has fielded a national team at this level of competition.

As with all competitive CEE programs, RSI and the USABO are free of cost to all participating scholars. CEE recognizes and supports the important work of the World Community Grid. CEE is also committed to do its part in finding and nurturing the world's top scientific talent. By joining the World Community Grid, CEE is able to continue its mission to support the very important work of scientists world-wide. Thanks World Community Grid for pioneering the way!

To join, employees, members, family and friends should go to [www.worldcommunitygrid.org](http://www.worldcommunitygrid.org) and simply download and install a free, small software program on their computers. When idle, your computers request data from World Community Grid's server. Computers then perform computations using this data, send the results back to the server and prompt it for a new piece of work.

World Community Grid provides an efficient and effective way to make a difference on problems that plague humanity. We are asking our employees, members, family and friends to join World Community Grid as part of our overall efforts to enrich the lives of humanity around the world. In addition, we would like for everyone to become a member of the Center for Excellence in Education team.
